### **“Eye on America” to feature new alternative energy process**

*April 18, 2008, Deerfield Beach, FL* – The producers of **Eye on America** are pleased to announce that *Intrinergergy* will be featured in an upcoming episode as part of the show’s series on *Fuelling the Future*.

Amid increasing concerns about the depletion of non-renewable fuel supplies and the deterioration of the environment, attention is turning to technologies that produce energy through new sources. Intrinergergy, a Virginia-based alternative energy company, utilizes leading edge gasification technology to convert landfilled or otherwise unused hydrocarbons, such as wood residues, industrial scrap, fiber residues and alternative feedstock, into usable energy.

The gasification process converts hydrocarbons into energy in an oxygen-starved environment, resulting in a synthetic gas which can be used much like natural gas. Depending on the installation, energy can also be output in the form of steam or electricity.

The process reduces greenhouse gas emissions and landfill contributions and lowers demand for non-renewable fossil fuels. In addition to the environmental benefits, users benefit from noticeable cost savings.

“There is no capital expenditure for our clients,” said John Keppler, Intrinergergy CEO. “We deliver on-site energy, similar to a utility and Intrinergergy is responsible for all operations and maintenance associated with the installation.”

“Through Intrinergergy’s gasification process, agricultural residues as well as byproducts such as rubber, plastic, carpeting, wood, fiber, construction and demolition materials, are transformed into alternative and renewable energy such as steam and power to drive industrial processes,” Keppler added.

Intrinergergy, based in Ashland, Virginia, was founded in 2004 and currently operates facilities in the North America and Europe.
